

Hardware Installation & Safety Brief

1. Overview This document outlines the mandatory steps for installing our network hardware. Follow these guidelines to ensure device safety and compliance with our installation standards.

2. Physical Mounting Requirements

- **Clearance:** Always leave at least 10cm of space around all sides. If the units get too hot, performance will drop.
- **Rack Mounting:** If it's a rack-mount unit, it *must* go into a standard 19-inch rack. Don't try to shimmy it into non-standard shelving.
- **Wall Mounting:** Only mount on solid, load-bearing walls. If you are dealing with drywall (non-concrete), stop and use heavy-duty toggle anchors. Do not use standard plastic plugs—they won't hold the weight over time.

3. Safety & Grounding

- Before flipping the power switch, make sure the chassis is grounded. I've seen enough equipment blow out because of static discharge.
- Ensure that no cables are pulling on the ports. If the cable is too tight, add some slack. It's better to have a messy cable look than a broken RJ45 port.

4. Pro-Tips from the Field

- **Access:** Try to mount wall units at about 2.5 meters high. It's high enough to stay out of the way but low enough that we don't need a massive ladder every time we need to hit the reset button.
- **Environment:** If the room is dusty, check the vents once a month.
